

# Hydrogen Faces Water Scarcity Risk

Media Mentions

February 06, 2023 | *Hydrogen Economist* | 1 minute read | London

---

Bracewell's **Tracy London** recently told *Hydrogen Economist* that the risk of water scarcity is a growing concern, but not necessarily the determining factor for whether a project goes ahead.

"Risk of water scarcity is certainly one of the factors that developers are looking into when it comes to cost-benefit analysis of a given location, but it is not necessarily a determining factor for whether a project goes ahead," said London.

She added that one of the advantages of siting hydrogen production projects at the site of former coal-fired power plants—such as Moorburg in Germany or Sines in Portugal—is the presence of an existing water source that can be repurposed for the new plant.
